

## Extending the Winter Fence Tape

A regular metal connector cannot be used for winter fence tape extensions, as it connects the shock and earthing conductor bundles of the winter tape together, which causes a short circuit.

Use a plastic **Duo insulator** to extend the winter fence tape. Carefully arrange the tapes on top of each other so that the shock voltage wire and earthing wire are aligned.

It doesn't matter which side is on top, green or white, as long as the sides of the same color meet.

It is therefore important that the wire bundle marked in red does not touch the wire bundle marked in green in any situation.
